FLORIDA VITAL STATISTICS 1983

INTRODUCTION

FOREWORD

This report summarizes data compiled from original birth, death, fetal death, marriage, and dissolution (of marriage) records filed with the Office of Vital Statistics (VS) as requird by law. Standard forms recommended by the U. S. Public Health Conference on Records and Statistics are used for certificates of birth, death and fetal death.

Responsibility for filing birth certificates lies with the physician, midwife or other attendant. Funeral directors, or other persons acting as such, are legally charged with filing death and fetal death (of 20 or more weeks gestation) certificates. These certificates are then submitted to local registrars who in turn forward them to VS. Marriage and dissolution records are received by VS directly from the various courts. Induced abortion reports are sent in directly by the physicians, hospitals and clinics.

RESIDENT AND RECORDED EVENTS

Births and deaths are tabulated according to both the usual "place of residence" (events occurring to Florida residents regardless of the place of occurrence) and the "place of occurrence" (events occurring in Florida regardless of the usual place of residence). The former are herein referred to as "resident" events and the latter as "recorded" events. Prior to 1933, only recorded data are available.

Varying interpretations of the "usual place of residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations to some extent, since the residence stated on the certificate is normally accepted without question. For births and fetal deaths, the mother's residence is used when it differs from the father's residence.

Marriage and dissolution of marriage data are by place of occurrence only; there is no interstate exchange of these records. However, Florida dissolutions of marriage are granted to legal residents only; so there can only be resident dissolutions.

AVAILABILITY OF DATA

In addition to data presented here, much greater detail is available from unpublished tables, and special statistical tapes and tables, upon request on a fee-for-service basis. Information concerning data available from these sources may be obtained from the Public Health Statistics and Records Registration Section, P. O. Box 210, Jacksonville, FL 32231; Telephone (904) 354-3961, ext. 3180, or Suncom 673-3180.

HISTORICAL BACKGROUND

This marks the 66th year of statewide collection of birth and death records, which began in 1917. Marriage and dissolution records have been filed with VS since June 1927.

CAUSE OF DEATH

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization (WHO) and the National Center for Health Statistics (NCHS). Standardized codes are assigned from the International Classification of Diseases (ICD).

To keep abreast of changes in medical knowledge, the ICD is revised approximately every ten years. Revisions and years used in Florida are:

Revision	Years	Revision	Years
Second	1917-1920	Sixth	1949-1957
Third	1921-1929	Seventh	1958-1967
Fourth	1930-1940	Eighth	1968-1978
Fifth	1941-1948	Ninth	1979-

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used or in which the changes from one revision to another were minor.

The Ninth Revision contains major modifications of some sections, so that more deaths are now assigned under Eighth Revision rules, and vice versa. NCHS coded a sample of 1976 U.S. deaths by both the Eighth and Ninth Revision rules. The results were grouped by major causes and, for each of these, the number of Ninth Revision deaths was divided by the number of Eighth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Suicide is 1.0032; this means that Ninth Revision coding of 10,000 death certificates will produce about 32 more suicides than would Eighth Revision rules.

National comparability ratios are shown in Table O for Florida's leading causes of death. When comparing deaths from these causes for 1979 or later to those for 1968-78, the ratio multiplied by the earlier data (either the number of deaths or death rate) will yield an approximation of the data which would have resulted under Ninth Revision rules.

INTRODUCTION
(cont'd)

RACE

Race is usually counted as it is stated on birth, death and marriage certificates, with such designations as "Hispanic" counted as white. For births, the child is counted as white if both parents are white, or if one is white and the other is unknown or not stated; the child is counted as nonwhite in all other cases where the race of at least one parent is known; and the child is counted as unknown only when the race of both parents is unknown or not stated. Specific nonwhite races are assigned according to a somewhat complex coding procedure, copies of which are available upon request. The 1970 U.S. Census for Florida showed a population that was 15.3 percent black and less than .04 percent for all other nonwhite races. The 1980 U.S. Census showed 13.8 percent black and 2.2 percent for all other nonwhite races. This increase in the other nonwhite races results mainly from changes in the Census Bureau's definitions.

UNKNOWNS

Tabular totals in this publication may include some records of unknown age, race or sex. In these cases, the components shown will not add to the total given.

COMPLETENESS OF DATA

Tabulation of data for this annual report was begun after allowing a reasonable time for receipt of late records. A few certificates were received after tabulation and thus are not included in this report. These records represent only a small fraction of the total, and their omission does not materially alter the facts presented.

COMPUTATION AND FOOTNOTES

The following procedures and symbols are used in all tables in this report:

(1) All rates and ratios are rounded to the nearest tenth.
(2) All rates and ratios that calculate to less than 0.05 are printed as "0.0".
(3) Undefined rates and ratios, i.e., those with denominators of zero, are printed as "---".
(4) Anomalous rates and ratios, i.e., those that calculate to greater than 999.9, are also printed as "---".
(5) Unreliable rates and ratios, i.e., those with denominators less than 100, are followed by an asterisk "*".
(6) All age-adjusted death rates (AADR) standardized to the U.S. 1940 standard population.

POPULATION

Florida's population continued to increase in 1983, up 1.9 percent from 1982 and 8.2 percent since 1980. Despite this, the 1980-83 annual average growth rate of 2.8 reveals a slight decrease in the trend. During the 1970's the growth rate averaged 3.6 percent annually.

The average annual numerical increase in population for 1970-79 of 292,752 includes a natural increase (excess of resident births over deaths) of 26,793. This results in an estimated net in-migration of 265,959 or 22,163 per month. This compares with a monthly in-migration of 11,014 during the 1960's.

The natural increase for 1980-83, with a monthly figure of 18,909, has declined from the average for the 1970's. The annual migration of 269,854 was also down from the previous decade. Both whites and nonwhites had growth rate declines when comparing the 1980-83 annual averages with those for 1970-79 (Table C).

Comparing Florida's population to that of the U.S., Florida's nonwhite population was 16.1 percent of the state total in 1983, compared to the U.S. percentage of 14.7. In the 65-and-over age group, Florida was at 18.2 percent, well above the U.S. figure of 11.7 percent. The 14-and-under age group comprised only 17.1 percent of Florida's population versus 22.0 percent nationally (Table A).

Midyear population estimates are based on April 1 intercensal estimates by the Bureau of Economic and Business Research, University of Florida. U.S. data were obtained from the Bureau of Census Current Population Reports, Series P-25 #949.

Based on 1980 data, all four race/sex groups continue to show increases in life expectancy at birth. White females continue to have the greater expectancy at 78.7 years; followed by nonwhite females, 77.8; white males, 70.8; and nonwhite males, 68.2. Prior to 1980, white males had a greater expectancy at birth than nonwhite females, but that has since changed, while white females and nonwhite males maintained the top and bottom positions, respectively (Table B).

Table B

YEARS OF LIFE EXPECTANCY AT BIRTH FOR FLORIDA RESIDENTS, BY RACE AND SEX, SELECTED YEARS, 1920-1980

BASED ON DATA FURNISHED BY BUREAU OF ECONOMIC AND BUSINESS RESEARCH, UNIVERSITY OF FLORIDA

LIVE BIRTHS

The general fertility rate in 1983 has increased by only 3.4 percent over the 1979-81 average. Although the increase is relatively small, it is in contrast to past trends which revealed a downward trend. Since the mid-1970's there has been an indication that the rates are beginning to rise slowly. The general fertility rates and the median age of mothers, for both whites and nonwhites, have also followed this pattern. The teenage groups continue to reveal a slight downward trend, although women in their thirties reveal an increase (Table D).

Live births to Florida residents continue to increase both in number and rate, as they have since 1977. In 1983 the number of live births rose by 3.2 percent, while the rate increased by only 1.4 percent. Both whites and nonwhites also reflect this general pattern, however, the rate for nonwhites remains nearly double the rate for whites (Table E).

Physicians continue to be the attendants to more than 90 percent of all live births for both whites and nonwhites. Despite this large percentage, physician deliveries have revealed a declining trend while midwife deliveries are beginning to increase and are thus becoming more widely utilized in deliveries. Among white live births in 1983, 94.0 percent were attended by physicians and 4.6 percent by midwives, as compared with 98.3 and 1.3 percent, respectively, for the 1974-76 average. Among nonwhites in 1983, physicians attended 90.7 percent of the live births and midwives 8.0 percent, as compared with 96.1 and 3.6 percent, respectively, for the 1974-76 average (Table F).

Low-weight live births have shown little change in 1983, although the trend has continued downward since the 1970's. All four race/sex groups reveal similar trend patterns. Studies have revealed that the risk of neonatal mortality is much greater for low-weight births as opposed to "normal" weight births. Low-weight births are classified as those less than 2500 grams or 5 1/2 pounds (Table G).

The percentage of live births to unwed mothers continues to increase in both number and rate, for whites as well as nonwhites. Since 1973 more than one-half of all nonwhite live births have been to unwed mothers. In 1983, one-third of all unwed mothers, both white and nonwhite, were under the age of 20. The median age for unwed mothers has increased since 1973, though, with the median age for whites and nonwhites being 22.0 and 21.9 years, respectively, in 1983 (Tables H and I).

PERINATAL &
INFANT MORTALITY

In Florida, a fetal death certificate is required only when the gestation period is 20 or more weeks. The fetal death ratio has shown a general downward trend over the past decade despite slight fluctuations in both numbers and rates during the late 1970's. The 1983 ratio of 10.7 has decreased 20.1 percent since 1973, even though the actual number of fetal deaths increased by 10.8 percent during the same period (Table J).

A neonatal death is a death which occurs within 28 days after the live birth. The combined total of fetal and neonatal deaths are referred to as "perinatal deaths", thus ranging from 20 weeks gestation through 27 days after the live birth. Both neonatal and perinatal deaths and rates continue their downward trends. These trends also continue for whites as well as nonwhites. The 1983 neonatal rate has decreased 20.6 percent since 1980, while the perinatal rate has declined 8.1 percent. Both the neonatal and perinatal rates have decreased considerably over the past ten years (Table K).

Infant deaths are those which occur within the first year of life. Despite the variations in the number of deaths over the past decade, the infant death rate continues its downward trend. The 1983 rate of 12.2 per thousand live births has declined 15.9 percent since 1980. Over the same time period, whites and nonwhites have shown decreases of 16.1 and 15.8 percent, respectively. The infant death rate, similar to the neonatal and perinatal ratios, has also decreased considerably over the past decade (Table L).

Table J

RESIDENT FETAL DEATHS* AND RATIOS PER 1000 LIVE BIRTHS, BY RACE, FLORIDA, 1960, 1970 AND 1973-1983

GENERAL MORTALITY

Resident deaths increased 4.3 percent in 1983 to 113,038 while the death rate increased by only 1.9 percent to 10.6 per thousand population. Florida's death rate actually declined during the early to mid-1970's before showing signs of increasing in the late 70's and into the early 80's. Despite this apparent trend, the rate is actually lower than it was ten years ago. The death rate for whites shows little change over the past decade, increasing only 1.8 percent, while the rate for nonwhites has declined by 27.0 percent. Among white males the rate declined slightly, -2.2 percent, while for white females there was an increase of 6.7 percent. The rates for nonwhite males and nonwhite females have dropped by 22.2 and 21.3 percent, respectively.

The age-adjusted death rate (AADR) continued its downward trend in 1983, decreasing to 5.3 for all races. The rate for whites fell to 5.1, while the rate for nonwhites rose to 7.1. Age-adjusted rates are based on the number of deaths for each age group and take into consideration the changes in the likelihood of death based on the age distribution of the population. All AADRs used in this report are standardized to the U.S. 1940 standard population (Table M).

Information on the disposition of remains is available for the four-year period beginning with 1980. These data show that during this period, the percentage of burials has decreased steadily while the percentage of cremations has increased. In 1983, 49.6 percent of all recorded deaths resulted in disposition by burial, while 28.0 percent were by cremation. Removal from the state accounted for 21.8 percent (Table N).

Heart Disease, Cancer, Stroke and Accidents continue as Florida's four leading causes of resident deaths, respectively, in 1983. Heart Disease continues its dominance as the leading cause, accounting for more deaths than Cancer, Stroke and Accidents combined. During the period from 1973 to 1983, COLD rose to fifth while Pneumonia & Influenza fell to sixth, reversing the rankings of ten years ago. Diabetes rose to seventh, Suicide to eighth and Atherosclerosis to tenth, while Chronic Liver Disease & Cirrhosis dropped from seventh to ninth and Homicide fell to eleventh.

Among whites, for the same ten-year period, the six leading causes remained the same: Heart Disease, Cancer, Stroke, Accident, COLD and Pneumonia & Influenza, respectively. Suicide and Diabetes rose to seventh and eighth, respectively, while Chronic Liver Disease & Cirrhosis dropped to ninth. Atherosclerosis remained in the tenth position.

Heart Disease, Cancer, Stroke, Accidents and Homicide remained as the five leading causes among nonwhites for 1983, as compared with 1973. Diabetes rose to sixth while Pneumonia & Influenza fell to seventh, thus reversing the rankings in 1973. Likewise, COLD rose to eighth and Chronic Liver Disease & Cirrhosis fell to ninth (Table O).

MARRIAGES

&

DISSOLUTIONS

The marriage rate continued its slowly increasing trend in 1983, rising to 11.2 per thousand population compared to 11.1 in 1982. The number of marriages also continued to rise in 1983, showing an increase of 2.7 percent over 1982.

The dissolutions of marriage (including annulments) rate decreased slightly, -1.5 percent, in 1983 to 6.7 per thousand population; the lowest rate since 1972. The increase in the marriage rate combined with the decrease in the dissolution rate has resulted in the rate of dissolutions per 100 marriages to fall to 60.0. This is the lowest rate in the past ten years and continues a downward trend which began in the mid-1970's.

Many of Florida's dissolutions are granted to persons who established residency in the state specifically for this purpose. These cases account for most of the difference between the Florida and U.S. dissolution rates, as well as for the high ratio of dissolutions per 100 marriages in Florida, as compared to a provisional rate of 48.2 nationally in 1983.

This ratio in Florida continues to decline after reaching a peak in 1975 when the ratio was 74.3. As other states become more liberal in their divorce laws, the difference between Florida and the nation should continue to lessen (Table JJ).

Table JJ

FLORIDA VITAL STATISTICS 1984

INTRODUCTION

FOREWORD

This report summarizes data compiled from original birth, death, fetal death, marriage, and dissolution (of marriage) records filed with the Office of Vital Statistics (VS) as required by law. Standard forms recommended by the U. S. Public Health Conference on Records and Statistics are used for certificates of birth, death and fetal death.

Responsibility for filing birth certificates lies with the physician, midwife or other attendant. Funeral directors, or other persons acting as such, are legally charged with filing death and fetal death (of 20 or more weeks gestation) certificates. These certificates are then submitted to local registrars who in turn forward them to VS. Marriage and dissolution records are received by VS directly from the various courts. Induced abortion reports are sent in directly by the physicians, hospitals and clinics.

RESIDENT AND RECORDED EVENTS

Births and deaths are tabulated according to both the usual "place of residence" (events occurring to Florida residents regardless of the place of occurrence) and the "place of occurrence" (events occurring in Florida regardless of the usual place of residence). The former are herein referred to as "resident" events and the latter as "recorded" events. Prior to 1933, only recorded data are available.

Varying interpretations of the "usual place of residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations to some extent, since the residence stated on the certificate is normally accepted without question. For births and fetal deaths, the mother's residence is used when it differs from the father's residence.

Marriage and dissolution of marriage data are by place of occurrence only; there is no interstate exchange of these records. However, Florida dissolutions of marriage are granted to legal residents only; so there can only be resident dissolutions.

AVAILABILITY OF DATA

In addition to data presented here, much greater detail is available from unpublished tables, and special statistical tapes and tables, upon request on a fee-for-service basis. Information concerning data available from these sources may be obtained from the Public Health Statistics and Records Registration Section, P. O. Box 210, Jacksonville, FL 32231-0042; Telephone (904) 359-6960 or Suncom 694-6960.

HISTORICAL BACKGROUND

This marks the 67th year of statewide collection of birth and death records, which began in 1917. Marriage and dissolution records have been filed with VS since June 1927.

CAUSE OF DEATH

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization (WHO) and the National Center for Health Statistics (NCHS). Standardized codes are assigned from the International Classification of Diseases (ICD).

To keep abreast of changes in medical knowledge, the ICD is revised approximately every ten years. Revisions and years used in Florida are:

Revision	Years	Revision	Years
Second	1917-1920	Sixth	1949-1957
Third	1921-1929	Seventh	1958-1967
Fourth	1930-1940	Eight	1968-1978
Fifth	1941-1948	Ninth	1979-

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used or in which the changes from one revision to another were minor.

The Ninth Revision contains major modifications of some sections, so that more deaths are now assigned under Eight Revision rules, and vice versa. NCHS coded a sample of 1976 U.S. deaths by both the Eight and Ninth Revision rules. The results were grouped by major causes and, for each of these, the number of Ninth Revision deaths was divided by the number of Eighth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Suicide is 1.0032; this means that Ninth Revision coding of 10,000 death certificates will produce about 32 more suicides than would Eight Revision rules.

National comparability ratios are shown in Table P for Florida's leading causes of death. When comparing deaths from these causes for 1979 or later to those for 1968-78, the ratio multiplied by the earlier data (either the number of deaths or death rate) will yield an aproximation of the data which would have resulted under Ninth Revision rules.

FLORIDA VITAL STATISTICS 1984

INTRODUCTION
(cont'd)

RACE

Race is usually counted as it is stated on birth, death and marriage certificates, with such designations as "Hispanic" counted as white. For births, the child is counted as white if both parents are white, or if one is white and the other is unknown or not stated; the child is counted as nonwhite in all other cases where the race of at least one parent is known; and the child is counted as unknown only when the race of both parents is unknown or not stated. Specific nonwhite races are assigned according to a somewhat complex coding procedure, copies of which are available upon request. The 1970 U.S. Census for Florida showed a population that was 15.3 percent black and less than .04 percent for all other nonwhite races. The 1980 U.S. Census showed 13.8 percent black and 2.2 percent for all other nonwhite races. This increase in the other nonwhite races results mainly from changes in the Census Bureau's definitions.

UNKNOWNS

Tabular totals in this publication may include some records of unknown age, race or sex. In these cases, the components shown will not add to the total given.

COMPLETENESS OF DATA

Tabulation of data for this annual report was begun after allowing a reasonable time for receipt of late records. A few certificates were received after tabulation and thus are not included in this report. These records represent only a small fraction of the total, and their omission does not materially alter the facts presented.

COMPUTATION AND FOOTNOTES

The following procedures and symbols are used in all tables in this report:

(1) All rates and ratios are rounded to the nearest tenth.
(2) All rates and ratios that calculate to less than 0.05 are printed as "0.0".
(3) Undefined rates and ratios, i.e., those with denominators of zero, are printed as "---".
(4) Anomalous rates and ratios, i.e., those that calculate to greater than 999.9, are also printed as "---".
(5) Unreliable rates and ratios, i.e., those with denominators less than 100, are followed by an asterisk "*".
(6) All age-adjusted death rates (AADR) standardized to the U.S. 1940 standard population.

POPULATION

Florida's population continued to increase in 1984, up 3.5 percent from 1983 and 12.0 percent since 1980. Despite this, the 1980-84 annual average growth rate of 3.0 reveals a slight decrease in the trend. During the 1970's the growth rate averaged 3.6 percent annually.

The average annual numerical increase in population for 1970-79 of 292,752 includes a natural increase (excess of resident births over deaths) of 24,276. This results in an estimated net in-migration of 268,476 or 22,373 per month. This compares with a monthly in-migration of 11,482 during the 1960's.

The natural increase for 1980-84, with a monthly figure of 21,736, has declined from the average for the 1970's. The annual migration of 294,707, however, was up slightly from the previous decade. Both whites and nonwhites had growth rate declines when comparing the 1980-84 annual averages with those for 1970-79 data.

Comparing Florida's population to that of the U.S., Florida's nonwhite population was 16.2 percent of the state total in 1984, compared to the U.S. percentage of 14.9. In the 65-and-over age group, Florida was at 18.5 percent, well above the U.S. figure of 11.9 percent. The 14-and-under age group comprised only 16.5 percent of Florida's population versus 21.9 percent nationally (Table A).

Midyear population estimates are based on April 1 intercensal estimates by the Bureau of Economic and Business Research, University of Florida. U.S. data were obtained from the Bureau of Census Current Population Reports, Series P-25 #965.

Based on 1980 data, all four race/sex groups continue to show increases in life expectancy at birth. White females continue to have the greater expectancy at 78.7 years; followed by nonwhite females, 77.8; white males, 70.8; and nonwhite males, 68.2. Prior to 1980, white males had a greater expectancy at birth than nonwhite females, but that has since changed, while white females and nonwhite males maintained the top and bottom positions, respectively (Table B).

Table B

YEARS OF LIFE EXPECTANCY AT BIRTH FOR FLORIDA RESIDENTS, BY RACE AND SEX, SELECTED YEARS, 1920-1980

YEAR *	TOTAL	WHITE		NONWHITE	
		MALE	FEM	MALE	FEM
1920	55.3	57.3	60.6	NA	NA

BASED ON DATA FURNISHED BY BUREAU OF ECONOMIC AND BUSINESS RESEARCH, UNIVERSITY OF FLORIDA

LIVE BIRTHS

The general fertility rate in 1984 has increased by only 2.7 percent over the 1979-81 average. Although the increase is relatively small, it is in contrast to past trends which revealed a downward trend. Since the mid-1970's there has been an indication that the rates are beginning to rise slowly. The general fertility rates and the median age of mothers, for both whites and nonwhites, have also followed this pattern. The teenage groups continue to reveal a slight downward trend, although women in their thirties reveal an increase (Table D).

Live births to Florida residents continue to increase both in number and rate, as they have since 1977. In 1984 the number of live births rose by 4.2 percent, while the rate increased by only 0.7 percent. Both whites and nonwhites also reflect this general pattern, however, the rate for nonwhites remains nearly double the rate for whites (Table E).

Low-weight live births have shown little change in 1984, although the trend has continued downward since the 1970's. All four race/sex groups reveal similar trend patterns. Studies have revealed that the risk of neonatal mortality is much greater for low-weight births as opposed to "normal" weight births. Low-weight births are classified as those less than 2500 grams or 5 1/2 pounds (Table F).

Physicians continue to be the attendants to more than 90 percent of all live births for both whites and nonwhites. Despite this large percentage, physician deliveries have revealed a declining trend while midwife deliveries are beginning to increase and are thus becoming more widely utilized in deliveries. Among white live births in 1984, 93.4 percent were attended by physicians and 5.2 percent by midwives, as compared with 98.3 and 1.2 percent, respectively, for the 1974-76 average. Among nonwhites in 1984, physicians attended 90.4 percent of the live births and midwives 8.2 percent, as compared with 96.1 and 3.6 percent, respectively, for the 1974-76 average (Table G).

The percentage of live births to unwed mothers continues to increase in both number and rate, for whites as well as nonwhites. Since 1974 more than one-half of all nonwhite live births have been to unwed mothers. The median age for unwed mothers has increased since 1974, though, with the median age for whites and nonwhites being 22.4 and 22.0 years, respectively, in 1984 (Tables H and I).

PERINATAL &
INFANT MORTALITY

In Florida, a fetal death certificate is required only when the gestation period is 20 or more weeks. The fetal death ratio has shown a general downward trend over the past decade despite slight fluctuations in both numbers and rates during the late 1970's. The 1984 ratio of 10.2 has decreased 20.9 percent since 1974, even though the actual number of fetal deaths increased by 12.7 percent during the same period (Table J).

A neonatal death is a death which occurs within 28 days after the live birth. The combined total of fetal and neonatal deaths are referred to as "perinatal deaths", thus ranging from 20 weeks gestation through 27 days after the live birth. Both neonatal and perinatal deaths and rates continue their downward trends. These trends also continue for whites as well as nonwhites. The 1984 neonatal rate has decreased 28.9 percent since 1980, while the perinatal rate has declined 14.1 percent. Both the neonatal and perinatal rates have decreased considerably over the past ten years (Table K).

Infant deaths are those which occur within the first year of life. Despite the variations in the number of deaths over the past decade, the infant death rate continues its downward trend. The 1984 rate of 10.8 per thousand live births has declined 25.5 percent since 1980. Over the same time period, whites and nonwhites have shown decreases of 28.0 and 19.9 percent, respectively. Despite these decreases, the rate for nonwhites remains about twice the rate for whites. The infant death rate, similar to the neonatal and perinatal ratios, has also decreased considerably over the past decade (Table L).

GENERAL MORTALITY

Resident deaths increased 1.6 percent in 1984 to 114,835 while the death rate decreased by only 1.9 percent to 10.4 per thousand population. Florida's death rate actually declined during the early to mid-1970's before showing signs of increasing in the late 70's and into the early 80's. Despite this apparent trend, the death rate is actually the same as it was ten years ago. For whites the rate has shown little change over the past decade, increasing only 2.8 percent, while the rate for nonwhites has declined by 14.6 percent (Table M).

The age-adjusted death rate (AADR) continued its downward trend in 1984, decreasing to 5.2 for all races. The rate for whites and nonwhites fell to 4.9 and 7.0, respectively. AADRs are based on the number of deaths for each age group and take into consideration the changes in the likelihood of death based on the age distribution of the population. All AADRs used in this report are standardized to the U.S. 1940 standard population (Table N).

Data on disposition of remains is available only since 1980. These data show that during this period, the percentage of burials has decreased steadily while cremations has increased. In 1984, 49.6 percent of all recorded deaths resulted in disposition by burial, while 29.0 percent were by cremation. Removal from state accounted for 20.9 percent. Among the race breakdowns burial accounted for 85.2 percent of all nonwhite dispositions as compared to only 45.3 percent for whites. Cremations were more prevalent among whites, accounting for 31.8 percent as compared with only 5.0 percent for nonwhites. Whites also accounted for more removals than the nonwhites, with percentages of 22.3 and 9.1, respectively (Table O).

Heart Disease continues its dominance as Florida's leading cause of death in 1984 accounting for more deaths than the next three causes combined, Cancer, Stroke and Accidents, respectively. During the period 1974 to 1984, COLD and Pneumonia & Influenza remained as the fifth and sixth leading causes, respectively, while Diabetes rose to seventh, Suicide to eighth and Homicide to tenth. Chronic Liver Disease & Cirrhosis and Atherosclerosis dropped to ninth and eleventh, respectively.

Among whites, for the same ten-year period, the six leading causes remained the same: Heart Disease, Cancer, Stroke, Accident, COLD and Pneumonia & Influenza, respectively. Suicide and Diabetes rose to seventh and eighth, respectively, while Chronic Liver Disease & Cirrhosis dropped to ninth and Atherosclerosis to tenth.

Heart Disease, Cancer, Stroke, Accidents and Homicide remained as the five leading causes among nonwhites for 1984, as compared with 1974. Diabetes rose to sixth while Pneumonia & Influenza fell to seventh, thus reversing the rankings in 1974. Likewise, COLD rose to eighth and Chronic Liver Disease & Cirrhosis fell to ninth. Atherosclerosis remained in the tenth position (Table P).

MARRIAGES
&
DISSOLUTIONS

The marriage rate continued its slowly increasing trend in 1984, rising to 11.5 per thousand population compared to 11.2 in 1983. The number of marriages also continued to rise in 1984, showing an increase of 6.3 percent over 1983.

The dissolutions of marriage (including annulments) rate increased slightly, 3.0 percent, in 1984 to 6.9 per thousand population. The increase in the marriage rate combined with the slight increase in the dissolution rate has resulted in the ratio of dissolutions per 100 marriages to fall to 59.7. This is the lowest rate in the past ten years and continues a downward trend which began in the mid-1970's.

Many of Florida's dissolutions are granted to persons who established residency in the state specifically for this purpose. These cases account for most of the difference between the Florida and U.S. dissolution rates, as well as for the high ratio of dissolutions per 100 marriages in Florida, as compared to a provisional rate of 46.4 nationally in 1984.

This ratio in Florida continues to decline after reaching a peak in 1975 when the ratio was 74.3. As other states become more liberal in their divorce laws, the difference between Florida and the nation should continue to lessen (Table LL).

Table LL

MARRIAGES AND DISSOLUTIONS OF MARRIAGE, RATES PER 1,000 POPULATION AND DISSOLUTIONS PER 100 MARRIAGES, FLORIDA, 1960, 1970 AND 1974-1984

YEAR	NUMBER OF MARRIAGES	RATES	NUMBER OF DISS.	RATES	DISS. PER 100 MARR.
1960	39,315	7.9	19,511	3.9	49.6
